MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY
Quality Assurance & Regulations

1

A Word About FSMA:

The **Food Safety Modernization Act** is a mandatory food safety law passed in 2011, that was the first major update to the federal food code since 1938.

The **Produce Safety Rule** is the part of it that applies to produce farms. It's based on **science like this**, and establishes minimum standards on farms to keep people safe.

Not every farm is subject to it, but every farm can use the practices laid out to protect our most vulnerable eaters.

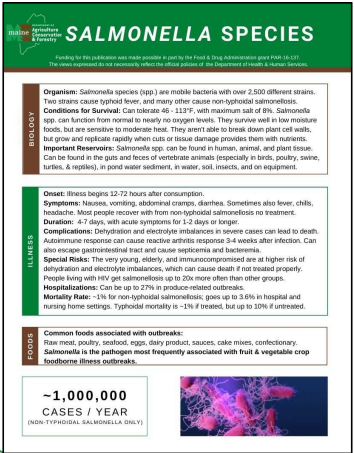

Our team does both the inspections and education for produce safety and we'll answer questions any time.

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

2

Pathogen Profiles

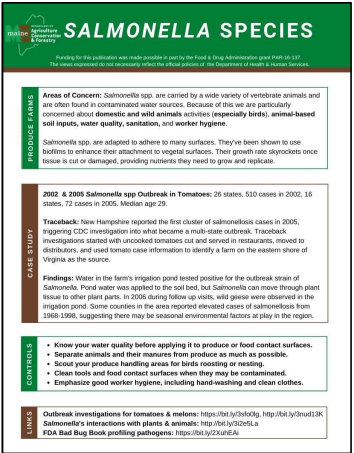

SALMONELLA SPECIES

Origins: Salmonella species (spp.) are motile bacteria with over 2,500 different strains. Two strains cause typhoid fever, and many other cause non-typhoidal salmonellosis. Conditions for Survival: Can tolerate 46 °F (-11°F), with maximum salt of 8%. Salmonella spp. can function from normal to nearly no oxygen levels. They survive well in low moisture foods, but are sensitive to moderate heat. They aren't able to break down plant cell walls, but grow and replicate rapidly when cuts or tissue damage provides them with nutrients. Important Reservoirs: Salmonella spp. can be found in human, animal, and plant tissue. Can be found in the guts and feces of vertebrate animals (especially in birds, poultry, swine, turkeys, & reptiles), in pond water sediments, in water, soil, insects, and on equipment.

Onset: Illness begins 12-72 hours after consumption. Symptoms: Fever, vomiting, abdominal cramps, diarrhea. Sometimes also fever, chills, headache. Most people recover with rest and hydration. Duration: 4-7 days, with acute symptoms for 1-2 days or longer. Complications: Dehydration and electrolyte imbalances in severe cases can lead to death. Autoimmune response can cause reactive arthritis response 3-4 weeks after infection. Can also increase gastrointestinal tract and cause septicemia and bacteremia. Special Risks: The very young, elderly, and immunocompromised are at higher risk of dehydration and electrolyte imbalances, which can cause death if not treated properly. People living with HIV get salmonellosis up to 20x more often than other groups. Hospitalizations: Can be up to 27% in produce-related outbreaks. Mortality Rate: ~1% for non-typhoidal salmonellosis; goes up to 3-6% in hospital and nursing home settings. Typhoidal mortality is ~1% if treated, but up to 10% if untreated.

Common foods associated with outbreaks: Raw meat, poultry, seafood, eggs, dairy product, sauces, cake mixes, confectionary. Salmonella is the pathogen most frequently associated with fruit & vegetable crop foodborne illness outbreaks.

~1,000,000 CASES / YEAR
(NON-TYPHOIDAL SALMONELLA ONLY)

SALMONELLA SPECIES

Area of Concern: Salmonella spp. are carried by a wide variety of vertebrate animals and are often found in contaminated water sources. Because of this we are particularly concerned about domestic and wild animals activities (especially birds), animal-based soil inputs, water quality, sanitation, and worker hygiene.

Salmonella spp. are adapted to adhere to many surfaces. They've been shown to use fimbriae to enhance their attachment to vegetal surfaces. Their growth rate slows down once tissue is cut or damaged, providing nutrients they need to grow and replicate.

2002 & 2005 Salmonella spp. Outbreak in Tomatoes: 26 states, 530 cases in 2002, 16 states, 72 cases in 2005. Median age 29.

Traceback: New Hampshire reported the first cluster of salmonellosis cases in 2005, triggering CDC investigation into what became a multi-state outbreak. Traceback investigations started with uncooked tomatoes cut and served in restaurants, moved to distributors, and used tomato case information to identify a farm on the eastern shore of Virginia as the source.

Findings: Water in the farm's irrigation pond tested positive for the outbreak strain of Salmonella. Pond water was applied to the soil bed, but Salmonella can move through plant tissue to other plant parts. In 2006 during follow-up visits, wild geese were observed in the irrigation pond. Some counties in the area reported elevated cases of salmonellosis from 1998-1999, suggesting there may be seasonal environmental factors at play in the region.

Controls:

- Know your water quality before applying it to produce or food contact surfaces.
- Separate animals and their manures from produce as much as possible.
- Isolate your produce handling areas for birds roosting or nesting.
- Clean tools and food contact surfaces when they may be contaminated.
- Emphasize good worker hygiene, including hand-washing and clean clothes.

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

3

Food Safety on Produce Farms

Americans are eating more produce than ever. As consumption of fruits and vegetables rises, so do cases of foodborne illness associated with produce.

The CDC estimates **48 million** people get sick from foodborne illness each year, **148,000** are hospitalized, and **3,000** die.

Microbial hazards are the leading cause of foodborne illnesses associated with produce.

4

Who Gets Sick?

A little dirt may be good for many of us, but it can really hurt our most vulnerable eaters, including:

- **Children.**
- **Elderly** people.
- **Pregnant** folks.
- People with **compromised immune systems.**

Keep these people in mind as we talk about pathogen risks on our produce farms.

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

5

Understanding Microbes

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

6

Key Terms

- Pathogen:** Any bacterium, virus, parasite, or other micro-organism that can cause illness.
- Reservoir:** Any animal, plant, soil, or substance where a pathogen normally lives and multiplies.
- Vector:** Anything that carries an infectious pathogen to or into another organism.

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

7

Key Terms

- Bacteria:** A type of single-celled organism that have cell walls, but lack organelles or a nucleus.
- Flagella:** A slender threadlike structure that bacteria and other microbes use to swim.
- Spore-forming:**
A type of bacteria that makes spores (a sturdy reproductive unit that can grow a new individual without other inputs).

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

8

Key Terms

Onset: The first time symptoms become noticeable.

Duration: The length of time the illness lasts.

-osis: An infection caused by the pathogen name it follows.

Septicemia: Blood poisoning.

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

9

The Big 3 Produce Pathogens

1. *Salmonella* species (spp.)
~1 million cases / year

2. *Escherichia coli* O157:H7
~63,000 cases / year

3. *Listeria monocytogenes*
~1,600 cases / year

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

10

The Big 3 Produce Pathogens

1. *Salmonella* species (spp.)

~1 million cases / year
of common salmonellosis.

~27% of patients will be hospitalized
in produce-related outbreaks.

~1% of patients will die.
This increases to 3.6% in hospital/nursing home settings.

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

11

Salmonella species (spp.)

Biology:

- *Salmonella* species (spp.) are a group of mobile bacteria that move using flagella.
- There are over 2,500 different strains.
- 2 strains cause typhoid fever.
- Many others cause non-typhoidal salmonellosis (infections).

Conditions for Survival:

- Function fine at normal oxygen levels and at nearly no oxygen levels.
- Can tolerate temperatures from 46° - 113 °F.
- Survive well in low moisture, but are sensitive to moderate heat.
- Adhere to things well, and grow rapidly once produce is cut or damaged.

Can move to different parts of the plants once it has an opening.

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

12

Salmonella species (spp.)

Important Reservoirs:

- Gut & feces of vertebrate animals, especially birds, swine, turtles, & reptiles.
- Also found in pond water sediment, soil, water, on insects, and on equipment.

Common Foods Associated With Outbreaks:

- Raw meat.
- Poultry.
- Seafood.
- Eggs and dairy.
- Raw fruits and vegetables.

Salmonella is the pathogen most frequently associated with foodborne illness outbreaks for fruits and vegetables.

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

13

Salmonella species (spp.)

Common Symptoms:

- Nausea, vomiting, abdominal cramps, diarrhea.
- Sometimes fever, chills, headache.
- Usually resolves with no treatment.

Onset:

- 12-72 hours after consumption.

Duration:

- 4-7 days, usually with 1-2 days of acute symptoms.

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

14

Salmonella species (spp.)

Complications:

- Dehydration and electrolyte imbalance in severe cases can lead to death.
- Autoimmune response can cause reactive arthritis response 3-4 weeks after infection.
- Can escape gastrointestinal tract and cause septicemia (blood poisoning) and bacteremia (tissue, organ, & joint poisoning).

Special Risks:

- The very **young**, the **elderly**, and the **immunocompromised** are at higher risk of dehydration & electrolyte imbalances.
- **People living with HIV** get salmonellosis up to 20x more than other groups, and are more likely to have repeat episodes.

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

15

Salmonella species (spp.)

Areas of Concern on Produce Farms:

- **Animal activity**, both domestic and wild.
- **Manures**, animal **feces**, & **animal-based soil amendments**.
- **Worker hygiene**, especially after handling animals (including pet turtles) or animal byproducts/manures.
- **Farm water sources**, including water used for irrigation, sprays, washing produce or food contact surfaces, or for washing hands.
- **Sanitation practices** to clean food contact surfaces.

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

16

Salmonella species (spp.)

Case Study:

2002 & 2005 Outbreaks of *Salmonella* spp. with Tomatoes:

- **510 illnesses** across **26 states** in 2002
- **72 illnesses** across **16 states** in 2005.
- **Median age** of patients was **29 years old** in 2005.

Traceback:

- NH reported first cluster of cases, triggering CDC investigation.
- ID-ed cut tomatoes served in restaurants as implicated food item.
- Followed the chain from restaurant to distributors to identify a farm on the eastern shore of Virginia as the source.

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

17

Salmonella species (spp.)

Findings:

- Water in the farm's irrigation pond tested positive for the outbreak strain.
- They had used it to water the soil beds, not directly on the tomatoes.
- *Salmonella* can move through plant tissue to other plant parts.
- During follow up inspections in 2006, flocks of wild geese were observed in the farm pond.
- Some counties in the area have been reporting seasonally elevated numbers of salmonellosis since 1968.
- **There may be a seasonal/environmental water quality issue in the growing region.**

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

18

***Salmonella* species (spp.)**

What You Can Do On Your Farm:

- **Watch for animal activity** in your produce areas.
- **Pay attention to bird activity on your farm.** (Where do they nest or swim?)
- **Separate animals** and their byproducts **from your produce areas** as much as possible.
- **Know your water quality** before applying it to produce or food contact surfaces.
- **Clean tools and food contact surfaces** when they might be contaminated.
- **Emphasize hand-washing and clean clothes** with your workers.

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

19

The Big 3 Produce Pathogens

***2. Escherichia coli* O157:H7**

~63,000 cases / year
of from *E. coli* O157:H7 alone.

~46% of patients will be hospitalized
in produce-related outbreaks.

~10% of patients develop hemolytic uremic syndrome.
Average mortality is 3-5%. Can be ~50% in elderly patients with HUS.

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

20

Escherichia coli O157:H7

Biology:

- *Escherichia coli* (*E. coli*) are non-spore-forming bacteria that move using flagella.
- Generic *E. coli* is so common in animal feces that it's used to indicate water quality. There are over 700 different strains.
- Many groups of *E. coli* cause traveler's diarrhea, infantile diarrhea, and bacillary dysentery.
- *E. coli* O157:H7 is the strain that most commonly causes foodborne illness.

Conditions for Survival:

- Function fine at normal oxygen levels and at nearly no oxygen levels.
 - Can tolerate temperatures from 45° - 113 °F.
- Thrives in warm, damp, dark environments.

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

21

Escherichia coli O157:H7

Important Reservoirs:

- Gut & feces of animals, especially in ruminants (cattle, deer, goats, sheep).
- Human are also common carriers.
- Can persist in dust, soil, sediment, and water for weeks and months.

Common Foods Associated With Outbreaks:

- Ground beef.
- Apple cider & unpasteurized apple juice.
- Raw milk & soft cheeses.
- Water.
- Raw vegetables, especially lettuce, leafy greens, & sprouts.

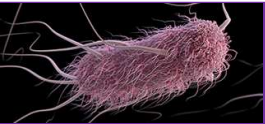

***E. Coli* O157:H7 is the second leading cause of fresh produce-related illness outbreaks.**

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

22

Escherichia coli O157:H7

Common Symptoms:

- Abdominal pain, diarrhea that starts out watery and often becomes bloody, vomiting, and fever.
- Antibiotics are usually not advised because they can lead to complications.

Onset:

- 3-4 days after consumption; can be up to 9 days after consumption.

Duration:

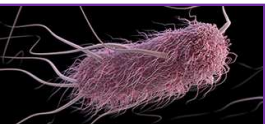

- ~8 days in typical cases.

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

23

Escherichia coli O157:H7

Complications:

- Diarrhea & vomiting can lead to severe and sometimes fatal dehydration.
- Extreme and grossly bloody diarrhea (called hemorrhagic colitis), as occurring as often as every 15-30 minutes.
- 10% of patients develop hemolytic uremic syndrome (HUS), which includes anemia, blood clotting problems, and acute kidney failure.
- Some HUS patients end up needing kidney transplants.

Special Risks:

- **Children**, the **elderly**, and the **immunocompromised** are at greater risk of developing serious infections.
- Death rates for **elderly** patients with HUS can be as high as 50%.

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

24

Escherichia coli O157:H7

Areas of Concern on Produce Farms:

- **Movements of cattle** and other ruminants (deer, goats, sheep).
- **Upstream/adjacent land use.**
- **Protection of farm water sources**, from both surface drainage and subsurface leaching.
- **Quality of water** and **methods of use** for produce irrigation, spraying, and sanitation of produce and food contact surfaces.
- **Manure storage** on-farm.
- **Worker hygiene**, including hand-washing and cleanliness.

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

25

Escherichia coli O157:H7

Case Study:

April 2018 Outbreak of *E. coli* O157:H7 in Romaine Lettuce:

- **210 illnesses** across **36 states**.
- **96 hospitalizations**, **27 cases of HUS**, **5 deaths**.
- **Median age** of patients was **28 years old**.

Traceback:

- Multi-state outbreak triggered CDC & FDA investigation.
- Contaminated Romaine was traced to Yuma growing region straddling the border of Arizona & California.
- 36 fields on 23 different farms were identified as the suppliers of the contaminated lettuce.

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

26

Escherichia coli O157:H7

Findings:

- A 3.5 mile stretch of irrigation canal used by many of the area's farmers tested positive for *E. coli* O157:H7.
- Several large cattle feeding operations adjacent to the irrigation canal were identified as the likely upstream source of the outbreak strain.
- Many farmers in the region had used water from the canal to dilute pesticides prior to application.
- A late frost led to some freezing injury on the lettuce, creating tissue damage.
- Pathogenic *E. coli* preferentially colonizes damaged edges of plant tissue.

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

27

Escherichia coli O157:H7

What You Can Do On Your Farm:

- **Separate animals & their manures** from produce and water sources.
- **Know your water quality** before using it for sprays, irrigating, or cleaning.
- **Look upstream** and consider **adjacent land use** that might drain into your fields or water sources.
- **Check the condition of your well** and/or **septic system**.
- **Don't harvest** produce that may have been contaminated by animal feces.
- **Think about your boots, wheels, and livestock traffic patterns.**
- **Emphasize hand-washing and clean clothes** with your workers.

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

28

The Big 3 Produce Pathogens

3. *Listeria monocytogenes*

~1,600 cases / year
of listeriosis.

~94 - 99% of patients will be hospitalized
in produce-related outbreaks.

~40% of patients can die
during produce-related outbreaks.

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

29

Listeria monocytogenes

Biology:

- *Listeria monocytogenes* is a non-spore-forming bacteria that moves using flagella.
- There are other species of *Listeria*, but only 1 other species is considered pathogenic, mostly to ruminants (cattle, deer, goats, sheep).

Conditions for Survival:

- Function fine at normal oxygen levels and at nearly no oxygen levels.
- Can survive and grow at temperatures as low as 1° - 113 °F.
- Salt and nitrile tolerant.
- Can form biofilms on various surfaces to help it resist environmental stress.
- Outcompetes other organisms that can't grow and replicate in cool, wet conditions.

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

30

Listeria monocytogenes

Important Reservoirs:

- *L. monocytogenes* is very prevalent in the environment.
- Guts & feces of ruminants (cattle, deer, goats, sheep) are important reservoirs.
- Also found in soil, silage, decaying vegetation, & cold, wet, difficult-to-clean areas of equipment and facilities.

Common Foods Associated With Outbreaks:

- Raw dairy.
- Meat & poultry.
- Seafood.
- Cooked, ready-to-eat foods.
- Raw fruits and vegetables, incl. melons, sprouts, & cut celery.

***Listeria monocytogenes* has the highest hospitalization rate out all 31 major foodborne pathogens.**

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

31

Listeria monocytogenes

Common Symptoms:

- Diarrhea, fever, fatigue in most healthy people.
- Headache, stiff neck, confusion, loss of balance, muscle aches.
- May be asymptomatic in healthy people.
- Usually treated with antibiotics.

Onset:

- 3 days – 3 weeks after ingestion.
- Can sometimes begin within hours of consumption.

Duration:

- Varies from several days to several weeks in healthy people.

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

32

Listeria monocytogenes

Complications:

- Invasive listeriosis can cause septicemia (blood poisoning), meningitis (inflammation around brain and spinal cord), or encephalitis (inflammation of the brain).
- Intrauterine or cervical infections can cause miscarriages and stillbirth.

Special Risks:

- **Pregnant people, fetuses, and newborns** are at particular risk of life-threatening illness if exposed to *L. monocytogenes* during pregnancy.
- **Elderly people** and the **immunocompromised** are at higher risk of invasive listeriosis.

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

33

Listeria monocytogenes

Areas of Concern on Produce Farms:

- **Cooler storage areas**, including along baseboards.
- **Floor drains.**
- **HVAC/Cooling equipment.**
- **Condensate** from cooling equipment.
- **Difficult-to-clean areas of produce equipment.**
- **Equipment design** appropriate to the type of crop it's being used with.
- Areas where **standing water pools.**

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

34

Listeria monocytogenes

Case Study:

2011 Outbreak of *Listeria monocytogenes* with Cantaloupe:

- 147 illnesses across 28 states.
- 145 hospitalizations, 33 deaths, 1 miscarriage.
- Median age of patients was 77 years old.

Traceback:

- Multistate outbreak triggered CDC & FDA investigation.
- Was the largest outbreak associated with *Listeria* in US history.
- Patients had leftover melon that was tested.
- Traceback went through retail stores to the broker back to a single farm in Colorado.

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

35

Listeria monocytogenes

Findings:

- All samples in the growing field (water, soil, animal feces, cantaloupes) were negative.
- Evaporators in the cooler weren't plumbed, creating standing water.
- Floor drains weren't easy to access to clean.
- A piece of potato equipment was being used to clean melons.
- No sanitizer was used in the spray bar.
- Multiple samples in the facility (floors, drains, equipment line, melons in cooler) tested positive, even after equipment was disassembled, cleaned, and sanitized.
- Facility didn't test negative until sections of equipment were removed and the line was re-cleaned.

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

36

Listeria monocytogenes

What You Can Do On Your Farm:

- **Plumb evaporators and cooling equipment.**
- **Prevent and eliminate standing water.**
- Make sure your **equipment is designed to allow for proper cleaning.**
- **Clean facilities and equipment regularly**, with detergents, not just water.
- **Keep produce from touching the floor/ground** as much as possible.
- **Use a sanitizer** in your wash water for high risk produce.
- **Get the field heat out** of your produce before storing it in the cooler.

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

37

The Big 3 Produce Pathogens

1. *Salmonella* species (spp.)
~1 million cases / year

2. *Escherichia coli* O157:H7
~63,000 cases / year

3. *Listeria monocytogenes*
~1,600 cases / year

MAINE DEPARTMENT OF AGRICULTURE, CONSERVATION & FORESTRY www.maine.gov/dacf/qar/

SALMONELLA SPECIES

Funding for this publication was made possible in part by the Food & Drug Administration grant PAR-16-137. The views expressed do not necessarily reflect the official policies of the Department of Health & Human Services.

BIOLOGY

Organisms: Salmonella species (spp.) are motile bacteria with over 2,500 different strains. Two strains cause typhoid fever, and many other cause non-typhoidal salmonellosis.

Conditions for Survival: Can tolerate 45°-123°F, with maximum salt of 8%. Salmonella spp. can function from normal to nearly no oxygen levels. They survive well in low moisture foods, but are sensitive to moderate heat. They aren't able to break down plant cell walls, but grow and replicate rapidly when cuts or tissue damage provides them with nutrients.

Important Reservoirs: Salmonella spp. can be found in human, animal, and plant tissue. Can be found in the guts and feces of vertebrate animals (especially in birds, poultry, swine, turkeys, & reptiles), in pond water sediment, in water, soil, insects, and on equipment.

ILLNESS

Onset: Illness begins 12-72 hours after consumption.

Symptoms: Nausea, vomiting, abdominal cramps, diarrhea. Sometimes also fever, chills, headache. Most people recover with non-typhoidal salmonellosis no treatment.

Duration: 4-7 days, with acute symptoms for 1-2 days or longer.

Complications: Dehydration and electrolyte imbalances in severe cases can lead to death. Autoimmune response can cause reactive arthritis response 3-4 weeks after infection. Can also encase gastro-intestinal tract and cause septicemia and bacteremia.

Special Risks: The very young, elderly, and immunocompromised are at higher risk of dehydration and electrolyte imbalances, which can cause death if not treated properly.

People living with HIV get salmonellosis up to 20x more often than other groups.

Hospitalizations: Can be up to 27% in produce-related outbreaks.

Mortality Rate: ~1% for non-typhoidal salmonellosis; goes up to 3.6% in hospital and nursing home settings. Typhoidal mortality is ~1% if treated, but up to 30% if untreated.

FOODS

Common foods associated with outbreaks: Raw meat, poultry, seafood, eggs, dairy product, sauces, cake mixes, confectionery. Salmonella is the pathogen most frequently associated with fruit & vegetable crop foodborne illness outbreaks.

**~1,000,000
CASES / YEAR**
(NON-TYPHOIDAL SALMONELLA ONLY)

SALMONELLA SPECIES

Funding for this publication was made possible in part by the Food & Drug Administration grant PAR-16-137. The views expressed do not necessarily reflect the official policies of the Department of Health & Human Services.

PRODUCE FACTS

Areas of Concern: Salmonella spp. are carried by a wide variety of vertebrate animals and are often found in contaminated water sources. Because of this we are particularly concerned about domestic and wild animals activities (especially birds), animal-based soil inputs, water quality, sanitation, and worker hygiene.

Salmonella spp. are adapted to adhere to many surfaces. They've been shown to use biofilms to enhance their attachment to vegetal surfaces. Their growth rate skyrockets once tissue is cut or damaged, providing nutrients they need to grow and replicate.

CASE STUDY

2002 & 2009 Salmonella spp Outbreak in Tomatoes: 26 states, 530 cases in 2002, 16 states, 72 cases in 2009. Median age 39.

Traceback: New Hampshire reported the first cluster of salmonellosis cases in 2005. Triggerring CDC investigation into what became a multi-state outbreak. Traceback investigations started with uncooked tomatoes cut and served in restaurants, moved to distributors, and used tomato case information to identify a farm on the eastern shore of Virginia as the source.

Findings: Water in the farm's irrigation pond tested positive for the outbreak strain of Salmonella. Pond water was applied to the soil bed, but Salmonella can move through plant tissue to other plant parts. In 2006 during follow up visits, wild geese were observed in the irrigation pond. Some counties in the area reported elevated cases of salmonellosis from 1999-2006, suggesting there may be seasonal environmental factors at play in the region.

CONTROL

- Know your water quality before applying it to produce or food contact surfaces.
- Separate animals and their manures from produce as much as possible.
- Sanitise your produce handling areas for birds, rodents or nesting.
- Clean tools and food contact surfaces when they may be contaminated.
- Emphasize good worker hygiene, including hand-washing and clean clothes.
